Information Management Exchange (IMAGE)

Conscientia Group helps companies optimize their organizational performance, protect their critical infrastructure, integrate technological solutions, and develop innovative solutions to achieve success. Our Information Management Exchange (IMAGE) software is a critical tool in enabling customers to achieve their desired goals and outcomes by easily compiling, translating and managing data to assess performance. Condensing data into a clear format, customers using IMAGE can quickly perform trend analyses and identify cause and effect relationships. Conducting these critical analyses enables IMAGE users to mitigate systemic problems associated with performance, allowing them to assume a proactive approach to their business operations and mitigate impacts that can cause irreparable financial and reputational damages.

Using IMAGE, critical data points are identified, collected and compiled within a software database. Similar to collecting pieces of stone, glass or tile and interconnecting them to form an appealing mosaic image, by applying Conscientia Group's IMAGE solution users have the ability to see a clear picture of their operations and quickly identify missing pieces and incongruities. Key data is captured and collected often times from remote geographical locations and entered into the system via an input portal. Information is sorted and presented in visually engaging and informative reports that are accessible via a customer information output dashboard for review and analysis.

IMAGE effectively enables our customers to use data driven metrics to analyze performance, develop strategies, measure success and optimize corporate intuition. The IMAGE solution can be applied to support businesses operating in nearly every market however it is most advantageously applied in support of the following critical areas:

Quality control

By tracking, monitoring and analyzing clear outputs within IMAGE, customers can evaluate performance indicators and compare results against requirements or expectations. Deficiencies are compartmentalized and cataloged in an after-action window that is used to highlight next steps for corrective action and document progress as it specifically relates to the identified discrepancy or incident.

Risk management

As part of our dashboard configuration, we identify and classify risks into specific categories. Targeted sets of data points are associated with varying degrees of severity. Users can quickly identify a series of data that correlates to non-conformance with regulatory requirements, service expectations, production levels, or whatever classification your organization desires. IMAGE enables customers to identify potential risks before they become problems that impact performance, so you can implement your risk management process effectively and with pinpoint precision.

Safety assessments

IMAGE serves as a powerful, data-driven tool for understanding, benchmarking and transforming your organization's approach toward world-class safety performance. Assessment data can be used to precisely validate safety methods that help reduce injuries and accidents by identifying deficiencies at the earliest stages before they become liabilities.

Conscientia Group's understanding of the business and technology dimensions coupled with our comprehensive suite of systems integrations help our customers harness internal and external data to improve service levels, decision-making and financial management. Our IMAGE software was specifically developed to help companies achieve superior quality control and focus their efforts toward process improvements. IMAGE enables customers to transform data into insightful information and achieve higher levels of performance.
